## IT314: Software Engineering

---

Name: Vipulkumar B. Ninama

Student ID: 202001218

LAB: 7

→ Consider a program for determining the previous date. Its input is triple of day, month and year with the following ranges  $1 \leq \text{month} \leq 12$ ,  $1 \leq \text{day} \leq 31$ ,  $1900 \leq \text{year} \leq 2015$ . The possible output dates would be the previous date or invalid date. Design the equivalence class test cases?

- a. **Class 1: Valid Dates** (Dates from (1, 1, 1900) to (31, 12, 2015) such that day, month and year are in the given ranges. ex: (13, 2, 2002), (3, 7, 2010), (21, 12, 1995) etc.)
- b. **Class 2: Invalid Dates** (Dates from (1, 1, 1900) to (31, 12, 2015) such that day, month and year are in the given ranges but the input is invalid. ex: (31, 6, 2002), (29, 2, 2010), (30, 2, 2000) etc.)
- c. **Class 3: Invalid Range** (Dates from (1, 1, 1900) to (31, 12, 2015) such that day, month and year are not in the given ranges. ex: (33, 6, 2020), (1, 16, 2033), (15, 0, 2022) etc.)
- d. **Class 4: Invalid Input** (Dates from (1, 1, 1900) to (31, 12, 2015) such that day, month and year are in the given ranges but the input is invalid. ex: (2, 1.2, 2022), (12, a, 2013), (-2, 5, 2010) etc.)

- **Tester Action and Input Data Expected Outcome:**

- **Valid Dates:**

- Test Case 1:  
Input: (13, 2, 2002)  
Output: (12, 2, 2002)
- Test Case 2:  
Input: (3,7,2010)  
Output: (2,7,2010)
- Test Case 2:  
Input: (21, 12, 1995)  
Output: (20, 12, 1995)

- **Invalid Dates:**

- Test Case 1:  
Input: (31, 6, 2002)  
Output: (30, 6, 2002)
- Test Case 2:  
Input: (29, 2, 2010)  
Output: (28, 2, 2010)
- Test Case 3:  
Input: (3,7,2010)  
Output: (2,7,2010)

- **Invalid Range:**

- Test Case 1:  
Input: (33, 6, 2020)  
Output: Invalid Date
- Test Case 2:  
Input: (1,16,2033)  
Output: Invalid Date
- Test Case 3:  
Input: (15,0,2022)  
Output: Invalid Date

- **Invalid Input:**

- Test Case 1:

- Input: (2, 1.2, 2022)

- Output: Invalid Date

- Test Case 2:

- Input: (12, a, 2013)

- Output: Invalid Date

- Test Case 3:

- Input: (-2, 5, 2010)

- Output: Invalid Date

- **Boundary Value Analysis:**

Test Case 1: Valid First Possible Date

Input: (1,1,1900)

Output: (31,12,1899) Which is not in range.

Test Case 2: Valid Last Possible Date

Input: (31,12,2015)

Output: (30,12,2015)

Test Case 3: One Day Before First Possible Date

Input: (31,1,1899)

Output: Invalid Input

Test Case 4: One Day After Last Possible Date

Input: (1,1,2016)

Output: Invalid Input

Test Case 5: Valid Leap Year Date

Input: (29,2,2000)

Output: (28,2,2000)

Test Case 6: Invalid Leap Year Date

Input: (29,2,1900)

Output: Invalid input

Test Case 7: Valid Date After Leap Year Date

Input: (1,3,2000)

Output: (29,2,2000)

Test Case 8: Valid Date After Non Leap Year Date

Input: (1,3,2019)

Output: (28,2,2019)

Test Case 9: Valid First Day of Month

Input: (1,3,2000)

Output: (31,12,1999)

Test Case 10: Valid First Day of Year

Input: (1,1,2000)

Output: (31,12,1999)

**→ Write a set of test cases (i.e., test suite) – specific set of data – to properly test the programs. Your test suite should include both correct and incorrect inputs.**

- Enlist which set of test cases have been identified using Equivalence Partitioning and Boundary Value Analysis separately.
- Modify your programs such that it runs on eclipse IDE, and then execute your test suites on the program. While executing your input data in a program, check whether the identified expected outcome (mentioned by you) is correct or not.

→ **Programs:**

→ **Program 1: Equivalence Partitioning and Boundary Value Analysis**

Tester Action and Input Data	Expected Outcome
<b>Equivalence Partitioning</b>	
a = [1, 2, 3, 4], v = 2	1
a = [5, 6, 7, 8], v = 10	-1
a = [1, 1, 2, 3], v = 1	0
a = null, v = 5	Error Message

Boundary Analysis	Expected Outcome
Minimum array length: a = [], v = 7	-1
Maximum array length: a = [1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20] v = 3	2
Minimum value of v: a = [5, 6, 7], v = 5	0
Maximum value of v: a = [1, 2, 3], v = 3	2

→ **Program 2: Equivalence Partitioning and Boundary Value Analysis**

Tester Action and Input Data	Expected Outcome
<b>Equivalence Partitioning</b>	
Invalid input: v is not an integer	Error Message
Empty array: a = []	0
Single item array: a = [v], v = a[0]	1

Multiple item array with v appearing:	
v appears once	1
v appears multiple times	Count > 1
Multiple item array with v not appearing	0

Boundary Analysis	Expected Outcome
Minimum input values: $v = a[0] = 1$	Count > 0
Maximum input values: $v = a[9999] = 10000$	Count > 0
One occurrence of v: $a = [1, 2, 3, \dots, 9999, v-1, 10000]$	1
All occurrences of v: $a = [v, v, v, \dots, v, v]$	10000
No occurrences of v: $a = [1, 2, 3, \dots, 9999]$	0

### → Program 3: Equivalence Partitioning

- **Test Cases For Correct & Incorrect Inputs:**

Tester Action and Input Data	Expected Outcome
v = 5, a = [1, 3, 5, 7, 9]	2
v = 1, a = [1, 3, 5, 7, 9]	0
v = 9, a = [1, 3, 5, 7, 9]	4
v = 2, a = [1, 3, 5, 7, 9]	-1
v = 2, a = [1, 3, 5, 7, 9]	-1
v = 6, a = []	-1

- **Test Cases For Correct & Incorrect Inputs:**

Tester Action and Input Data	Expected Outcome
v = 5, a = [5, 6, 7]	0
v = 6, a = [5, 6, 7]	1
v = 7, a = [5, 6, 7]	2
v = 5, a = [1, 5, 6, 7, 9]	1
v = 6, a = [1, 5, 6, 7, 9]	2
v = 7, a = [1, 5, 6, 7, 9]	3
v = 9, a = [1, 5, 6, 7, 9]	4
v = 1, a = [1]	0
v = 5, a = [5]	0
v = 5, a = []	-1

$v = 2, a = [1, 3, 5, 7, 9]$	-1
$v = 6, a = [1, 3, 5, 7, 9]$	-1
$v = 10, a = [1, 3, 5, 7, 9]$	-1
$v = 1, a = [2, 3, 4, 5, 6]$	-1
$v = 4, a = [2, 3, 4, 5, 6]$	-1
$v = 7, a = [2, 3, 4, 5, 6]$	-1

**→ Program 4: Equivalence Partitioning and Boundary Value Analysis**

Tester Action and Input Data	Expected Outcome
<b>Equivalence Partitioning</b>	
$a=b=c$ , where $a, b, c$ are positive integers	Equilateral
$a=b < c$ , where $a, b$ , and $c$ are positive integers	Isosceles
$a=b=c=0$	Invalid
$a < b+c, b < a+c, c < a+b$ , where $a, b, c$ are positive integers	Scalene
$a=b > 0, c=0$	Invalid
$a > b+c$	Invalid

Boundary Value Analysis	Expected Outcome
$a=1, b=1, c=1$	Equilateral
$a=1, b=2, c=2$	Isosceles
$a=0, b=0, c=0$	Invalid

a=2147483647, b=2147483647, c=2147483647	Equilateral
a=2147483646, b=2147483647, c=2147483647	Isosceles
a=1, b=1, c=2 <sup>31</sup> -1	Scalene
a=0, b=1, c=1	Invalid

### Program 5: Equivalence Partitioning and Boundary Value Analysis

Tester Action and Input Data	Expected Outcome
<b>Equivalence Partitioning</b>	
s1 is empty, s2 is non-empty string	True
s1 is non-empty string, s2 is empty	False
s1 is a prefix of s2	True
s1 is not a prefix of s2	False
s1 has same characters as s2, but not a prefix	False

Boundary Analysis	Expected Outcome
s1 = "a", s2 = "ab"	true
s1 = "ab", s2 = "a"	false
s1 = "a", s2 = "a"	true
s1 = "a", s2 = "A"	false
s1 = "abcdefghijklmnopqrstuvwxyz",	true

s2 = "abcdefghijklmnopqrstuvwxy <sup>z</sup> "	
s1 = "abcdefghijklmnopqrstuvwxy <sup>z</sup> ", s2 = "abcdefghijklmnop <sup>no</sup> "	true
s1 = "", s2 = ""	true

→ Modify your programs such that it runs on eclipse IDE, and then execute your test suites on the program. While executing your input data in a program, check whether the identified expected outcome (mentioned by you) is correct or not.

- I have taken 20 test cases (4 test cases per program). Where eight are wrong or invalid, and the other 12 are correct.
- There are screenshots of code snippets with coverage of the code.

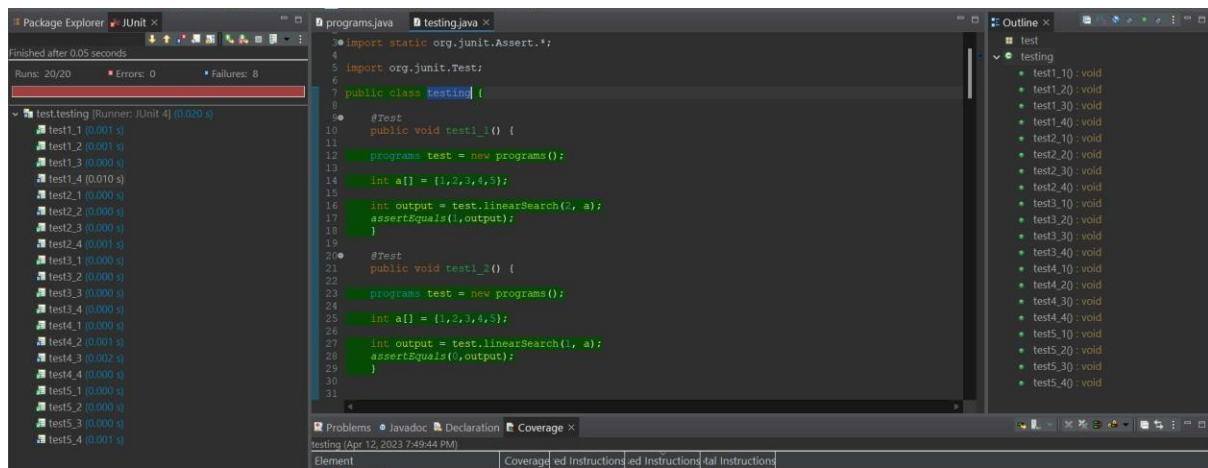

The screenshot displays the Eclipse IDE interface. The central editor shows a Java file named `testing.java` with the following content:

```

1 package test;
2
3 import static org.junit.Assert.*;
4
5 import org.junit.Test;
6
7 public class testing {
8
9     @Test
10    public void test1_1() {
11        programs test = new programs();
12
13        int a[] = {1,2,3,4,5};
14
15        int output = test.linearSearch(2, a);
16        assertEquals(1,output);
17    }
18
19    @Test
20    public void test1_2() {
21        programs test = new programs();
22
23        int a[] = {1,2,3,4,5};
24
25        int output = test.linearSearch(1, a);
26        assertEquals(0,output);
27    }
28
29    @Test
30    public void test1_3() {
31        programs test = new programs();
32
33        int a[] = {1,2,3,4,5};
34    }
35
36 }

```

The left sidebar shows the Package Explorer with a JUnit run configuration named `test1_1 [Runner: JUnit 4] (0.000 s)`. The right sidebar shows the Outline view with a list of test cases: `test1_10 : void`, `test1_20 : void`, `test1_30 : void`, `test1_40 : void`, `test2_10 : void`, `test2_20 : void`, `test2_30 : void`, `test2_40 : void`, `test3_10 : void`, `test3_20 : void`, `test3_30 : void`, `test3_40 : void`, `test4_10 : void`, `test4_20 : void`, `test4_30 : void`, `test4_40 : void`, `test5_10 : void`, `test5_20 : void`, `test5_30 : void`, and `test5_40 : void`.

- **Modified Java Codes for the given programs:**

```
package LabPackage;

public class programs {

    public int linearSearch(int v, int a[]) // p1
    {
        int i = 0;
        while (i < a.length)
        {
            if (a[i] == v)
                return(i);
            i++;
        }
        return (-1);
    }

    public int countItem(int v, int a[]) //p2
    {
        int count = 0;
        for (int i = 0; i < a.length; i++)
        {
            if (a[i] == v)
                count++;
        }
        return (count);
    }

    public int binarySearch(int v, int a[]) //p3
```

```

{
    int lo,mid,hi;
    lo = 0;
    hi = a.length-1;
    while (lo <= hi)
    {
        mid = (lo+hi)/2;
        if (v == a[mid])
            return (mid);
        else if (v < a[mid])
            hi = mid-1;
        else
            lo = mid+1;
    }
    return(-1);
}

final int EQUILATERAL = 0;
final int ISOSCELES = 1;
final int SCALENE = 2;
final int INVALID = 3;
public int triangle(int a, int b, int c) //p4
{
    if (a >= b+c || b >= a+c || c >= a+b)
        return(INVALID);
    if (a == b && b == c)
        return(EQUILATERAL);
    if (a == b || a == c || b == c)
        return(ISOSCELES);
    return(SCALENE);
}

public boolean prefix(String s1, String s2) //p5
{
    if (s1.length() > s2.length())
    {
        return false;
    }
    for (int i = 0; i < s1.length(); i++)
    {
        if (s1.charAt(i) != s2.charAt(i))
        {
            return false;
        }
    }
    return true;
}

```

- **Test Cases with Coverage:**

```
package LabPackage;

import static org.junit.Assert.*;

import org.junit.Test;

public class TestCases {

    @Test
    public void test1_1() {
        programs test = new programs();
        int a[] = {1,2,3,4,5};
        int output = test.linearSearch(2, a);
        assertEquals(1,output);
    }

    @Test
    public void test1_2() {
        programs test = new programs();
        int a[] = {1,2,3,4,5};
        int output = test.linearSearch(1, a);
        assertEquals(0,output);
    }

    @Test
    public void test1_3() {
        programs test = new programs();
        int a[] = {1,2,3,4,5};
        int output = test.linearSearch(7, a);
        assertEquals(-1,output);
    }

    @Test
    public void test1_4() {
        programs test = new programs();
        int a[] = {1,2,3,4,5};
        int output = test.linearSearch(7, a);
        assertEquals(0,output);
    }

    @Test
    public void test2_1() { // no of element p2
        programs test = new programs();
        int a[] = {1,2,3,4,5};
        int output = test.countItem(2, a);
        assertEquals(2,output);
    }
}
```

```
@Test
public void test2_2() { //no of element p2
    programs test = new programs();
    int a[] = {1,2,3,4,5};
    int output = test.countItem(4, a);
    assertEquals(2,output);
}
```

```
@Test
public void test2_3() { //no of element p2
    programs test = new programs();
    int a[] = {1,2,3,4,5};
    int output = test.countItem(6, a);
    assertEquals(0,output);
}
```

```
@Test
public void test2_4() { //no of element p2
    programs test = new programs();
    int a[] = {1,2,3,4,5};
    int output = test.countItem(6, a);
    assertEquals(-1,output);
}
```

```
@Test
public void test3_1() { //binary search p3
    programs test = new programs();
    int a[] = {1,2,3,4,5};
    int output = test.binarySearch(2, a);
    assertEquals(1,output);
}
```

```
@Test
public void test3_2() { //binary search p3
    programs test = new programs();
    int a[] = {1,2,3,4,5};
    int output = test.binarySearch(3, a);
    assertEquals(3,output);
}
```

```
@Test
public void test3_3() { //binary search p3
    programs test = new programs();
    int a[] = {1,2,3,4,5};
    int output = test.binarySearch(8, a);
    assertEquals(-1,output);
}
```

```
@Test
public void test3_4() { //binary search p3
```

```
programs test = new programs();
int a[] = {1,2,3,4,5};
int output = test.binarySearch(8, a);
assertEquals(-1,output);
}
```

```
@Test
public void test4_1() {
programs test = new programs();
int output = test.triangle(8,8,8);
assertEquals(0,output);
}
```

```
@Test
public void test4_2() {
programs test = new programs();
int output = test.triangle(8,8,10);
assertEquals(2,output);
}
```

```
@Test
public void test4_3() {
programs test = new programs();
int output = test.triangle(0,0,0);
assertEquals(1,output);
}
```

```
@Test
public void test4_4() {
programs test = new programs();
int output = test.triangle(0,0,0);
assertEquals(3,output);
}
```

```
@Test
public void test5_1() {
programs test = new programs();
boolean output = test.prefix("", "nonEmpty");
assertEquals(true,output);
}
```

```
@Test
public void test5_2() { // example of s1 is prefix of s2
programs test = new programs();
boolean output = test.prefix("hello", "hello world");
assertEquals(true,output);
}
```

```
@Test
```

```

public void test5_3() { // example of s1 is not prefix of s2
    programs test = new programs();
    boolean output = test.prefix("hello","world hello");
    assertEquals(false,output);
}

@Test
public void test5_4() { // example of s1 is not prefix of s2
    programs test = new programs();
    boolean output = test.prefix("hello","world hello");
    assertEquals(true,output);
}
}

```

**P6: Consider again the triangle classification program (P4) with a slightly different specification: The program reads floating values from the standard input. The three values A, B, and C are interpreted as representing the lengths of the sides of a triangle. The program then prints a message to the standard output that states whether the triangle, if it can be formed, is scalene, isosceles, equilateral, or right angled.**

**Determine the following for the above program:**

**A. Equivalence classes for the system are:**

Class 1: Invalid inputs (negative or zero values)

Class 2: Non-triangle (sum of the two shorter sides is not greater than the longest side)

Class 3: Scalene triangle (no sides are equal)

Class 4: Isosceles triangle (two sides are equal)

Class 5: Equilateral triangle (all sides are equal)

Class 6: Right-angled triangle (satisfies the Pythagorean theorem).

**B. Test cases to cover the identified equivalence classes:**

Class 1: -1, 0

Class 2: 1, 2, 5

Class 3: 3, 4, 5

Class 4: 5, 5, 7

Class 5: 6, 6, 6

Class 6: 3, 4, 5

Test case 1 covers class 1, test case 2 covers class 2, test case 3 covers class 3, test case 4 covers class 4, test case 5 covers class 5, and test case 6 covers class 6.

**C. Test cases to verify the boundary condition  $A + B > C$  for the scalene triangle:**

(1) 2, 3, 6

(2) 3, 4, 8

Both test cases have two sides shorter than the third side and should not form a triangle.

**D. Test cases to verify the boundary condition  $A = C$  for the isosceles triangle:**

(1) 2, 3, 3

(2) 5, 6, 5

Both test cases have two equal sides and should form an isosceles triangle.

**E. Test cases to verify the boundary condition  $A = B = C$  for the equilateral triangle:**

(1) 5, 5, 5

(2) 9, 9, 9

Both test cases have all sides equal and should form an equilateral triangle.

**F. Test cases to verify the boundary condition  $A^2 + B^2 = C^2$  for the right-angled triangle:**

(1) 3, 4, 5

(2) 5, 12, 13

Both test cases satisfy the Pythagorean theorem and should form a right-angled triangle.

**G. For the non-triangle case, identify test cases to explore the boundary.**

(1) 2, 2, 4

(2) 3, 6, 9

Both test cases have two sides that add up to the third side and should not form a triangle.

**H. For non-positive input, identify test points.**

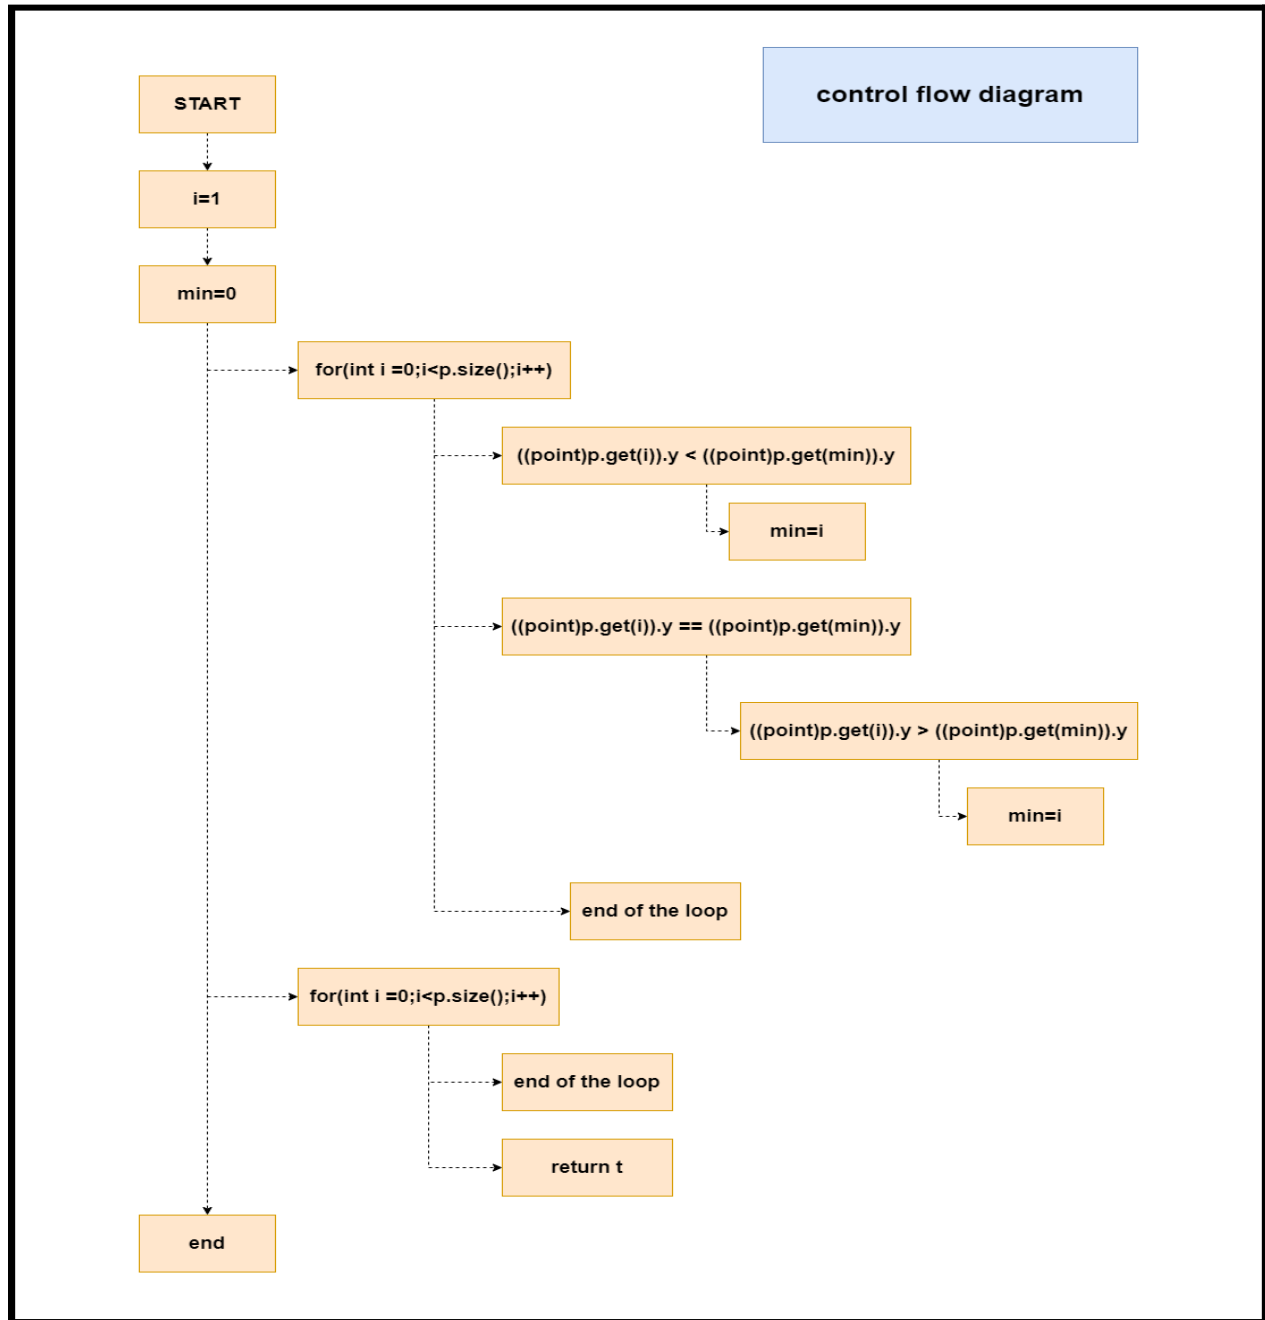

(1) 0, 1, 2

(2) -1, -2, -3

Both test cases have at least one non-positive value, which is an invalid input.

## Section-B

1. Convert the Java code comprising the beginning of the doGraham method into a control flow graph (CFG).

**1. Construct test sets for your flow graph that are adequate for the following criteria:**

**a. Statement Coverage.**

To satisfy statement coverage, we need to ensure that each statement in the CFG is executed at least once. We can achieve this by providing a test case with a single point in the vector. In this case, both loops will not execute, and the return statement will be executed. A test set that satisfies statement coverage would be:

$p = [\text{Point } (0,0)]$

**b. Branch Coverage.**

To satisfy branch coverage, we need to ensure that each branch in the CFG is executed at least once. We can achieve this by providing a test case with two points such that one of the points has the minimum y-coordinate, and the other has a greater x-coordinate than the minimum. In this case, both loops will execute, and the second branch in the second loop will be taken. A test set that satisfies branch coverage would be:

$p = [\text{Point } (0,0), \text{Point } (1,1)]$

**c. Basic Condition Coverage.**

To satisfy basic condition coverage, we need to ensure that each condition in the CFG is evaluated to both true and false at least once. We can achieve this by providing a test case with three points such that two of the points have the same y-coordinate, and the other has a greater x-coordinate than the minimum. In this case, both loops will execute, and the second condition in the second loop will be evaluated to true and false. A test set that satisfies basic condition coverage would be:

$p = [\text{Point } (0,0), \text{Point } (1,1), \text{Point } (2,0)]$
